

FACTORY COATING SYSTEM

JSC CedarShield

Factory Applied Coating System

JSC Cedarshield Coating System

Our factory applied coating systems are designed to protect and enhance your timber and were specifically developed to manage and increase performance in the harsh New Zealand environment. For longevity, stability and appearance, we recommend cedar is coated on all four sides before installation, cut ends are sealed and that the coating is reapplied on site in accordance to the manufacturer's specifications.

We offer a range of coating options (paint/stain/oil). By working closely with coating manufacturers and our clients, we offer the appropriate coating system to meet your design requirements.

Coating Partners

A wide range of products and colours are available from our coating partners; including Cabots, CD50, Dryden, Dulux, Resene and Wattyl.

Subsequent coating(s) should be applied to all exposed surfaces in accordance with the requirements of the product manufacturer.

NB: JSC Timber is happy to provide a two-coat factory applied coating option if approved by the product manufacturer, but an on-site coat may still be required.

For oil/stain application, we recommend a bandsawn face. The timber fibres are loose allowing the oil to penetrate into the board giving a consistent, even finish. With consideration given to board width and grain, cedar is particularly well suited to stain/oil finishes.

Our CedarShield Factory applied coating is used extensively for exterior environments. It offers you the option of enhancing the colour characteristics of your timber, while still allowing the grain structure to show through.

Coatings from a range of Product Manufactures in your choice of colour

Benefits

JSC CedarShield ensures a consistent application for improved appearance and increased finish life and durability. Factory applied coating can be substantially cheaper than on-site application and eliminates the issues associated with lack of site space, access and contamination.

Designed to protect the timber from UV degradation, our CedarShield systems will greatly reduce moisture content fluctuations, enhance performance, and will prolong the life of the finish and improve stability.

In addition to cladding solutions; including weatherboards, fascia, paneling and dressed profiles, it is ideal for all bandsawn and various other finishes, including beams, pergolas, gates, and window frames.
